In the Team Round the entire team of six students will have 20 minutes to answer the 10 problems. The team members may collaborate freely, but as with all rounds in the Duke Math Meet, only pencil and paper may be used. After 20 minutes the team will submit a single sheet with its answers to each of the 10 problems. The team will be given 10-minute, 1-minute, and 15-second warnings. Each correct answer will add 2 points to the team's score.

## TEAM ROUND

1. You are on a flat planet. There are 100 cities at points  $x = 1, \ldots, 100$  along the line y = -1, and another 100 cities at points  $x = 1, \ldots, 100$  along the line y = 1. The planet's terrain is scalding hot, and you cannot walk over it directly. Instead, you must cross archways from city to city. There are archways between all pairs of cities with different y coordinates, but no other pairs: for instance, there is an archway from (1, -1) to (50, 1), but not from (1, -1) to (50, -1). The amount of "effort" necessary to cross an archway equals the square of the distance between the cities it connects. You are at (1, -1), and you want to get to (100, -1). What is the least amount of effort this is the least amount of effort this journey can take?

- 2. Let  $f(x) = x^4 + ax^3 + bx^2 + cx + 25$ . Suppose a, b, c are integers and f(x) has 4 distinct integer roots. Find f(3).
- 3. Frankenstein starts at the point (0,0,0) and walks to the point (3,3,3). At each step he walks either one unit in the positive x-direction, one unit in the positive y-direction, or one unit in the positive z-direction. How many distinct paths can Frankenstein take to reach his destination?
- stitute the the 4. Let ABCD be a rectangle with AB = 20, BC = 15. Let X and Y be on the diagonal  $\overline{BD}$  of ABCD such that BX > BY. Suppose A and X are two vertices of a square which has two sides on lines AB and AD, and suppose that C and Y are vertices of a square which has sides on CBand CD. Find the length XY. linte mat 3 18 matitute ## # ' K Autitute the the "A the

They enter a haunted house in a single-file line such that each kid is friends with precisely the kids (or kid) adjacent to him. Inside the haunted house, they get mixed up and out of order. They meet up again at the exit, and leave in single file. After leaving, they realize that each kid (except the first to leave) is friends with at least one kid who left before him. In how many possible orders could they have left the haunted house?

6. Call a set S sparse if every pair of distinct elements of S differ by more than 1. Find the number of sparse subsets (possibly empty) of  $\{1, 2, \ldots, 10\}$ .
